                                                                                                                                                                                                                                                                                                                                                                                        kinase II.*;
J. Biol. Chem. 268:18157-18166(1993).

-!-PUNCTION: May mediate the control of various cellular processes b insulin. When phosphorylated by the insulin receptor binds specifically to various cellular proteins containing SH2 domains ench as phosphatidylinositol 3-kinase p85 subunit or GRB2.
-!-SIMILARITY: Contains 1 PHB domain.
                                                                                                                                                                                                                                     MEDLINE=93352637; PubMed=8349691;

"Structural basis for IL-4 receptor phosphopeptide recognition by the IRS-1 PTB domain..";
Nat. Struct. Biol. 3:388-393(1996).

**Attact. Biol. 3:388-393(1996).

**Institution: When phosphorylated by the insulin receptor binds specifically to various cellular proteins containing SH2 domains such as phosphatidylinositol 3-kinase p85 subunit or GRB2.

**Institution: When phosphatidylinositol 3-kinase p85 subunit or GRB2.

            This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the Buropean Bioinformatics Institute. There are no restrictions on its was by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
          and activated alpha 2-macroglobulin, as well as the local
and activated alpha 2-macroglobulin, as well as the local
merabolism of complexes between plasminogen activators and their
endogenous inhibitors. Binds vitellogenin, calcium and alpha 2-
calcade and activators and their
endogenous inhibitors. Binds vitellogenin, calcium and alpha 2-
calcade acceptance of macroglobulin.

ö
immunoglobulin L-chain of kappa-type, subgroup 3 (Bence-Jones protein RT Ti). IV. The complete amino acid sequence and its significance for the mechanism of antibody production.";

L HOPPE-Seyler's Z. Physiol. Chem. 333:189-208 (1972).

C -!- MISCELLANEOUS: THE C REGION OF THIS CHAIN HAS THE INV (3) MARKER.

-!- MISCELLANEOUS: This is a Bence-Jones protein.

FASEB J. 17:1969-1971(2003).
-!- FUNCTION: May. be involved in epidermal differentiation and
-!- FUNCTION: May. be involved in epidermal differentiation and
-!- fullammation and might therefore be important for the pathogenesis
of psoriasis and other diseases.
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SUBLIBARITY: Overexpressed in psoriasis.
-!- SIMILARITY: Belongs to the S-100 family.
-!- SIMILARITY: Contains 1 EF-hand calcium-binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MEDLINE-22881852; PubMed=12923069; Molf R., Mirnohammadsadegh A., Malz M., Lysa B., Tartler U., Remus R., Hengep U., Mirhel G., Ruzicka T.; Hengep U., Michel G., Ruzicka T.; Hongep U. WPI; 2001-616774/71. N-PSDB; AAS59521. Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.

Example 1; SEQ ID NO 5028; 1069pp; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by p. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory

presence or absence of P. acnes in a partient comprises contacting the presence or absence of P. acnes in a partient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used adapostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formatt directly from WIPO at

New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

Example 1; SEQ ID NO 5028; 1481pp; English.

The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polynucleotide of the invention; antibodies against polypeptides of the invention; antibodies against polypeptides of the invention; encompassed to an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides.) 

polymucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the reading frame) contained within the P. acnes polymucleotides of the reading frame) to but was obtained in electronic form a directly the printed specification, but was obtained in electronic format directly from WIPO at ftp. WiPo.int/published\_pot\_sequences \$

New polynuclectides and polypeptides, useful for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy.

Claim 1; Page; 222pp; English

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel

Use of an inhibitor of a Hedgehog signaling pathway in preparation of a medicament for treating epithelial cell hyperplasia, inflammation, cancer or an immune disorder.

Disclosure; Page 71; 78pp; English

```
CC polypeptides. Also claimed is a polypeptide encoded by the polymucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polymucleotide, immunologically assaying the polypeptide or peptide of the polymucleotide by contacting the polypeptide or peptide of the polymucleotide by contacting the polypeptide or peptide or with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polymucleotide in an expressible manner and an antisense polymucleotide. The oligonucleotide is useful as a primer for synthesising the polymucleotide, or as a probe for detecting the polymucleotide. The oligonucleotide contacting are useful as a primer for synthesising the polymucleotide, or as a probe for detecting the polymucleotide and many disease-related proteins are useful as pharmaceutical agents and many disease-related contacts and many disease-related contacts and proteins, signal transduction-related proteins, signal transduction-related proteins, contacting them can be used as indicators for diseases (e.g. ostcoporosis, the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention, Note: Some of the content of the polymucleoting them encoded protein of the polymucleotide in the printed content of the content of the protein of the protein of the printed content of the protein of the printed content of the protein of the printed content of the protein of the protein of the printed content of the protein of the printed content of the protein of the protein of the printed content of the printed content of the protein of the preference information supplied by the

```
This sequence is mouse dishevelled-1 (DV1-1), and is part of the Hedgehog signalling pathway. The invention relates to the use of an inhibitor of a fight ling pathway. The invention relates to the use of an inhibitor of a Hedgehog signalling pathway, in the preparation of a medicament for treating epithelial cell hyperplasia, fibrosis of tissue, inflammation, cancer (especially adenocarcinoma) or an immune disorder. The immune of usorder can be an autoimmune disorder. The immune of usorder can be an autoimmune disorder such as thyroiditis, insultis, multiple sclerosis, iridocyclitis, veeitis, orchitis, hepatitis, addisor's disease, wysathenia gravis, rheumatoid arthritis or lupus carcinome, chronic obstructive airway disorders including aslou useful for treating lung or kidney diseases such as adult respiratory distress synthmache, chronic obstructive airway disorders including aslou useful for treating lung or kidney diseases such as adult respiratory diseases including alloosis, hypersensitivity diseases of lung such as including allicosis, hypersensitivity diseases of lung such as idiopathic pulmonary fibrosis, pneumonia including interstitial preumonia and acute interstitial preumonia, and pleural fibrosis. pneumonia including interstitial preumonia including interstitial preumonia, and pleural fibrosis. They can also be used in the trearment of infarmation associated with atherocalerosis, e.g. wyocardial infarction, diseases of the central nervous system e.g. Alzheimer's disease and diseases of the defendence pathway is that of Sonic hedgehog signalling pathway is that or Bobbert hedgehog signalling pathway is were the BMP signalling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

pathway or a modulator of a target of the pathway in the preparation of medicament for treating T-cell mediated disease or infection or a disease or disorder associated with increased or decreased T-cell apoptosis and cor modification of (peripheral) T-cell activation or proliferation or T-cell apoptosis, and for modulation of the Notch signalling pathway in immune cells. The modulator is useful for treating cancer of the breast, prostem or ovary, lymphomas and carcinomas, autoimmune diseases such as systemic lupus erythematosus, multiple sclerosis and diseases such as stherosis and diseases.

Inflammatory diseases such as atherosis and psoriasis, viral inflections such as AlDS and herpesviruses, genetic immunodeficiencies, neurodegenerative diseases such as Alzheimer's disease and Parkinson's disease, myelodysplastic syndromes such as albastic anaemia, ischaemic injuries such as myocardial infarction, toxin-induced diseases such as carkoas and wasting diseases such as cachexia. This sequence represents the mouse dishevelled-1 (DVI-1) protein
                                                                                        Use of a modulator of Hedgehog signaling pathways for treating T-cell mediated disease or infection and diseases associated with increased or decreased T-cell apoptosis and T-cell proliferation.
                                                                                                                                                                                       The invention relates to use of a modulator of a Hedgehog signalling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Purified nucleic acid encoding Insulin Receptor Substrate - used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel protein IRSAL and encoding gene for modifying insulin physiological activity and controlling intake of saccharides into cells, applicable in gene diagnosis and screening e.g. drug candidates for type II diabetes.
                                                                           The sequence given is the rat insulin receptor substrate-1 (IRS-1). The IRS-1 gene was isolated using the probe sequences given in AAQ29701-02. The IRS-1 sequence can be inserted into a vector and used to transform cells to produce IRS-1. The level of IRS-1 metabolism can then be studied and abnormal levels may be seen to be indicative of insulin related disease. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the IRSAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises the amino acid and coding sequence of the IRSA protein which functions to modify insulin physiological activity and control the intake of saccharides into cells. The DNA and protein sequences of the invention are useful in gene diagnosis and screening (e.g. drug candidates for type II diabetes). The present amino acid sequence represents a rat IRSAL-related protein
prepare IRS-1, for diagnosis and treatment of insulin related diseases and abnormal cellular proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to modulators that affect the interaction of a polypeptide defining a PI (phosphotyrosine interaction) domain, or its conserved variants or fragments, with APP (amyloid precursor protein). The polypeptide defining a PI domain binds to the cytoplasmic domain of APP, regulating the secretion of APP fragments. By modulating this interaction, the modulator can inhibit or prevent APP processing and trafficioning, and thus progress or onset of Alzheimer's disease. The modulators are used to treat and/or prevent neurodegenerative diseases in mammals, particularly Alzheimer's disease and dementia. Sequences AAY13448-461 represent examples of polypeptides defining a PI domain
                                                                                                                                Phosphotyrosine interaction domain; PI domain; modulator; APP; amyloid precursor protein; cytoplasmic domain; Alzheimer's disease; neurodegenerative disease; dementia; IRS-1.
                                                                                                                                                                                                                                                                                                                                                                                                                           Cell line for screening agents that inhibit processing of amyloid precursor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 39; DB 2; Length 1242;

This invention describes a method for the treatment of diseases involving insulin resistance using a substance which inhibits the binding of insulin receptor substrate to 14-3-3 protein, identified by screening potential inhibitors for their ability to inhibit this binding. The composition described in the invention for the treatment of diseases involving insulin resistance contains as active component, an inhibitor of the binding of all or part of insulin receptor substrate 1 or 2 (IRS-1) to all or part of insulin receptor substrate 1 or 2 (IRS-1) to all or part of 14-3-3 protein. Disorders involving insulin resistance include diaberes, diabetic retinopathy, diabetic neuropathy, impaired glucose tolerance, diabetic nephropathy, hyperinsullnaemia, hyperlipemia, arteriossclerosis, hypertenaion, obestry, ischaemic heart disease, ischaemic brain disease and peripheral embolism
                                                                                                                                                                                                                                                                                                                                      Treatment of insulin resistance using insulin receptor substrate binding inhibitor.

Insulin receptor substrate; IRS-1; IRS-2; inhibitor; disease; obesity;

Human IRS-1 and IRS-2 binding inhibitor protein.

(first entry)

30-JUN-1999

AAW93972;

Al-Mahmood S;

```
The present sequence represents a human insulin receptor substrate (IRS).

Compounds which inhibit IRS also inhibit growth of tumours which

coverexpress human asparty1 (asparaginy1) beta-hydroxylase (HAAH) enzyme.

Epidermal growth factor (EGF) like domains of polypeptides are

hydroxylated by HAAH enzymes. HAAH is used in the method of the

invention. The specification describes a method for diagnosing a

malignant neoplasm in a mammal. The method comprises contacting a body

fluid with an antibody which binds to HAAH polypeptide under complex

forming conditions, and detecting the antigen-antibody complex. The

method is useful for diagnosing and prognosing a malignant neoplasm in a

conjuly fluid e.g. central nervous system (CNS) derived body fluid, blood

serum, urine, saliva, sputum, lung effusion, and ascites fluid of mammal,

where the neoplasm is derived from endodermal lissue and is salected from

colon cancer, breast cancer, pancretic cancer, liver cancer, cancer, one

colon cancer, breast cancer, pancretic cancer, liver cancer, or

section, are useful for killing tumour cells
                                                                                                                                                                        Diagnosing malignant neoplasm in a mammal, involves contacting mammalian sample with antibody that binds to human aspartyl beta-hydroxylase polypeptide to form antigen-antibody complex and detecting the complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             IRS-1; insulin receptor substrate-1; angiogenesis; capillary tube; endothelial cell; retinopathy; rheumatoid arthritis; Crohn's disease; atheroscleroscis; ovarian hyperstimulation; psoriasis; endometriosis; restencesis; wound healing; peripheral vascular disease; hypertenation; vascular inflammation; Raynaud disease; aneurysm; arterial restencesis; thrombophlebitis; lymphodema; isohemia; angina; myocardial infarction; chronic heart disease; macular degeneration; osteoporosis; cell multiplication; antitumor.

The present sequence represents IRS-1 (insulin receptor substrate-1) polypeptide. IRS-1 is used to produce the compositions of the invention. The specification describes an angiogenesis-andifying composition. Containing at least one a nucleic acid selected from the gene encoding IRS-1 or a molecule that inhibits expression of that nucleic acid. The composition inhibits the formation of capillary tubes by endothelial composition inhibits the formation of capillary tubes by endothelial composition is used to treat and diagnose diseases associated with angiogenesis, particularly retinopathy, rheumatoid arthritis, crown sidease, atherosclerosis, ovarian hyperstimulation, psoriasis, cendometriosis, restenosis after ablloon angioplasty, overproduction of tissue during wound healing, peripheral vascular diseases, hypertension, vascular inflammation, Raymand disease, aneurysm, arterial restenosis, thrombophlebitis, lymphagitis, lymphodema, ischemia, angina, mycoardial infarction, chronic heart disease, (congestive) cardiac insufficiency, age-related macular desentation and osteoporosis.
                                                                                                         Angiogenesis-modifying composition, useful for treatment or diagnosis of e.g. retinopathy, comprises inhibitor of expression of the insulin receptor substrate-1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           prevent cell multiplication, especially as antitumor agents, and as research reagents for in vitro or in vivo studies on signalling pathways
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; aspartyl (asparaginyl) beta-hydoxylase; HAAH; cytostatic; immunostimulant; antibody; neoplasm; tumour; FB50; 86A; 5C7; 19B; brain tumour; glioma; glioblastcma; astrocytoma; haemangloma; pancreatic carcinoma; colon cancer; breast cancer; pancreatic cancer; liver cancer; cancer of the bile ducts; primary malignant CNS neoplasm; metastatic CNS neoplasm; IRS-1; insulin receptor substrate-1; mutant;

Diagnosing neoplasm and inhibiting tumor growth, by contacting tissue of mammal with detectably-labeled antibody which binds to human aspartyl (asparaginyl) beta-hydroxylase.

Example 7; Page; 34pp; English

The invention relates to diagnosing a neoplasm and inhibiting tumour congrowth in a mammal, using an antibody that binds to human asparty desparability) beta-hydroxylase (ERAM). Diagnosing a neoplasm comprises contacting a tissue with a decerably labelled antibody where an increase in level of attibody binding at tissue site. Compared to the level of binding to normal non-neoplastic tissue indicates the presence of a composition in ammanal involves administering the antibody conjugated to a cytoroxic agent to a mammal. Also manned involves administering the antibody of conferring an immune response to a tumour cell in a mammal, by administering the antibody and ammal, by administering the antibody and ammal, by administering the antibody and the mammal into the mammal into HAAH-specific immune response in a mammal, by administering to the mammal cell in a mammal, by administering to the mammal cell in a mammal, by administering to the mammal cell and laterage of the composition encoding the artibody and HAAH poperising an extracellular domain and lacking a cytoplasmic fomain of HAAH, an extracellular domain and lacking a cytoplasmic form hybridoma FBSO, continued and HAAH which lacks enzymatic activity or alpha-kecogluterate binding domain and epidermal growth factor (EGF) like domain. The methods are useful for diagnosing neoplasm of activity or abrain tumour cell (e.g. glioma, glioblascoma, astrocyroma contractic carcinoma cell and for inducing a HAAH-specific immune ceponse in a mammal. The method is useful for diagnosing malignant concert, pancreatic carcinoma cell and for inducing a HAAH-specific immune ceponse in a mammal. The method is useful for diagnosing malignant concert, pancreatic carcinoma cell and for inducing a HAAH-specific immune cell oright and metastatic CNS neoplasms of both neuronal and glial concert, lavaression when activated by the IRS-1 signal transduction caecade. Cumours e.g. glioma, glioblastoma, astrocytoma and conferent sequence represence and concert of the present sequence is no

Diagnosing neoplasm and inhibiting tumor growth, by contacting tissue mammal with detectably labeled antibody which binds to human aspartyl (asparaginyl) beta-hydroxylase.

Example 7; Page; 34pp; English.

The invention relates to diagnosing a neoplasm and inhibiting tumour CC growth in a mammal, using an antibody that binds to human aspartyl growth in a mammal, using an antibody that binds to human aspartyl carboar-hydroxylase (HAAH). Diagnosing a neoplasm comprises contacting a tissue with a detectably-labelled antibody where an increase to lare to comman in non-neoplastic tissue side compared to the presence of a binding to normal non-neoplastic tissue indicates the presence of a complasm at the tissue site. Inhibiting tumour growth in mammal involves administering the antibody conjugated to a cytocoxic agent to a tumour call in a mammal, by administering to the mammal. HAAH-specific immune response in a mammal, by administering to the mammal. The polypeptide (or a polymocleotide composition encoding the artibody or its fragment which binds to HAAH (where the antibody is FBSO, extracellular domain and lacking a cytoplasmic domain of HAAH conprising an extracellular domain and lacking a cytoplasmic domain of HAAH conprising an extracellular domain and lacking a cytoplasmic domain of HAAH which lacks enzymatic artibody or its fragment which binds to HAAH which lacks enzymatic catcivity or 1989, and alforman call line chosen from hybridoma FBSO, HABSO, HABSO, HABSO, and HAA19B, and a fragment of HAAH which lacks enzymatic activity or alpha-ketoglutarate binding domain and epidermal growth factor (ESP)-like domain. The methods are useful for diagnosing menions or namemal, inhibiting tumour cell (e.g. glioma, glioblastoma, astrocytoma or haemangioma) in a mammal, for conferring immune concer, pancreatic cancer, liver cancer and cancer of the bile ducts. The response to a mammal, for conferring immune concer, pancreatic cancer, liver cancer and cancer of the bile ducts. The method is also useful for diagnosing neoplasms of colon cancer, breast cancer, pancreatic cancer, liver cancer and cancer of the bile ducts. The method is also useful for diagnosing neoplasms of colon cancer, breast cuencer, liver cancer and canc

Diagnosing neoplasm and inhibiting tumor growth, by contacting tissue of mammal with detectably-labeled antibody which binds to human aspartyl (asparaginyl) beta-hydroxylase.

Example 7; Page; 34pp; English

The invention relates to diagnosing a neoplasm and inhibiting tumour cycowth in a mammal, using an antibody that binds to human aspartyl (asparaginyl) beta hydroxylase (HAAM). Diagnosing a neoplasm comprises contacting a tissue with a detectably labelled antibody where an increase in level of antibody binding at tissue site compared to the level of binding to normal non-neoplastic tissue indicates the presence of a administering the antibody conjugated to a cytocoxic agent to a mammal. Also included are a method of conferring an immune response to a tumour cell in a mammal, by administering the antibody, a method of inducing an HAAH-specific immune response in a mammal, by administering the antibody is method of inducing an extracellular domain and lacking a cytoplasmic domain of HAAH, and lacking a cytoplasmic domain of HAAH comprising an extracellular domain and lacking a cytoplasmic domain of HAAH, conferring to the mammal conferring and induced are a method of conferring a cytoplasmic domain of HAAH, conferring to the mammal extracellular domain. The methods are useful for diagnosing neoplasm of artibody or its fragment of a tragment of HAAH (where the antibody is FBSO, 684, 5C7 or 198), a hybridoma call line chosen from hybridoma FBSO, HA186A, HA15CA and HA2199, and a fragment of HAAH (where the antibody is FBSO, 684, 5C7 or 198), a hybridoma call line chosen from hybridoma response to a brain tumour call line chosen from hybridoma servivity or alpha-ketoglutarate binding domain and epidermal growth factor (EGF)-like domain. The methods are useful for diagnosing method cancer. Conferring immune response to a brain tumour call inference and cancer of the bile duces. The method is useful for diagnosing malignant complasms derived from endodermal tissue, e.g. colon cancer, breast carcinoma cell and for inducing a HAAH-specific immune cell origin and metastatic Carcinoma cell and for inducing a diagnosing malignant cell origin and metastatic carcinoma cell and cancer, live response to a gent proplasms of centr

Sequence 14, Application US/08477531B
; Sequence 14, Application US/08477531B
; Patent No. 5821123
; GENERAL INFORMATION:
; APPLICANT: Studinicka, Gary M.
TITLE OF INVENTION: Modified Antibody Variable Domains (as amended)
; VUMBER OF SEQUENCES: 67
CORRESPONDENCE ADDRESS:
; ADDRESSEE: Sterne, Kessler, Goldstein and Fox P.L.C.
STREET: 1100 New York Ave., N.W., Suite 600
CITY: Washington
STATE: D.C.
COUNTRY: United States of America
ZIP: 20005-3934
COMPUTER REDABLE FORM:
; MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
; COMPUTER: IBM PC compatible
; COMPUTER: IBM PC compatible
; COMPUTER: OF STREET: PC-DOS/MS-DOS
; COMPUTER: PLOSSEE: PC-DOS/MS-DOS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 38; DB 1; Length 107;

Alpha-Z-macroglobulin receptor precursor - chicken

Alpha-Z-macroglobulin receptor precursor - chicken

NAlternate names: 1091; LDL receptor-related protein 1; low density lipoprotein receptor

Contes and Seps 1988 #sequence_revision 04-Sep-198 #text_change 22-Jun-1999

Cyaccession: AS3102

Nimpf, J. S. Stifani, S.; Bilous, P.T.; Schneider, W.J.

J. Biol. Chem. 269, 212-219, 1994

Altitle: The Somatic Cell-specific low density lipoprotein receptor-related protein of the Alternate number: AS3102; MUD:94103212; PMID:7506255

A; Description: Human IgM(+)IgD(+) cells, the major B cell subset in the peripheral blood A; Reference number: 837501
A; Accession: 837510
A; Status: preliminary
A; Molecule type: mRNA
A; Residues: 1-92 «KLB»
A; Residues: 1-92 «KLB»
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
